Designed for continuous vacuum sources, such as oilfilled vacuum pumps, aspirators, or systems that are "always on", like inhouse vacuum systems. The DVR200 regulates pressure by opening and closing a valve that separates the vacuum source from the system being evacuated. In most cases, the DVR200 is the best choice. A pressure ramp feature evacuates equipment at a user defined rate to eliminate bumping due to solvent degassing or overevacuation. The vacuum regulator is ideally suited for large volume distillations, rotary evaporators and vacuum chambers. To demonstrate the simplicity of the regulator, the following example is given. Turn on the vacuum pump. When in the OFF position, the regulator isolates the rotovap from the vacuum pump so the rotovap can be open to the atmosphere while the pump is running. When placed in the METER position, the regulator evacuates the rotovap to the pressure entered into the meter. When in the FULL VACUUM position, the regulator ignores the set point pressure and fully evacuates the rotovap removing the last amount of solvent. Place the next flask on the rotovap and move the regulator switch to the METER position to begin the process again. The pump can run continuously and there's no need to change the set point pressure. Solvent recoveries from a typical rotary evaporator are shown in the table below. The only requirement is that the vacuum source be lower in pressure than the pressure you want to regulate the equipment at. That is, to achieve a vacuum of 40 torr in the attached equipment, the vacuum source must be at least 40 torr. The Digital Vacuum Regulator doesn't create a vacuum; it only regulates the vacuum from an external vacuum source. <http://jagtapnursery.com/jagtap-nursery/upload/a-manual-for-writers-of-term-papers-theses-and-dissertations-download.xml>
