a suitable carrier. Helps prevent thread breakage. <http://www.novvit.ru/upload/file/98-fatboy-service-manual.xml>

Im completely new to sewing machines well, except for really cheap home machines and am not the most mechanically inclined so please be patient with me. I spoke on the phone with Bob from Toledo Sewing Machines a bit today, who I bought a servo motor off, but I didnt want to bug him too much so Im hoping some of you out there could give me a hand. Any help or suggestions whatsoever would be hugely appreciated. Thanks. By that, I mean, I have to tug on the thread right after the first post it threads through to give it slack, then pull from where it exits the needle. There doesnt seem to be any excessive tension anywhere, it just seems to be a cumulative effect. This leads me to wonder if Im threading it wrong, which by reading the manual and looking at all the comparative pictures and youtube videos I can find, it seems Im doing it right. I do see that theres a metal plate on the back that pushes against a spring to disengage the threads, but I dont see any mechanism that would push the plate to disengage. Hmmm. I am very likely screwing something up somewhere so let me know if you see something fishy. Thank you! And fix that thread cup on the stand. They should both be horizontal with spools in place. You seem to have daisy wired it in and out. Does the lifter now separate the disks Push the tensioner assembly inward and tighten the set screw. If not, see if the retainer plate can be forced inward in the middle area. You must have some rod protruding out the back in order to have the disks separate. See if any parts or bent out of shape or loose. The parts are definitely under one thousand dollars. And fix that thread cup on the stand. They should both be horizontal with spools in place. Still pretty hard to pull though.is that just the nature of the thicker thread. The cup stands seemed wrong to me.ha. Will definitely fix it. You seem to have daisy wired it in and out. Am currently trying it your way.

Does the lifter now separate the disks Just a small amount so I didnt notice before. It could probably push it out a little further. As for loosening the bobbin tension.I cant figure out for the life of me how to do this from what the manual describes.Does it matter which one The picture didnt make it on your post. Can anyone tell me which way the bobbins supposed to go in Im completely new to sewing machines well, except for really cheap home machines and am not the most mechanically inclined so please be patient with me. Thank you! It looks to be behind the rear disc instead of between both disc. I havent seen on like that in a long time. This is the rod that pushes the tension release lever whenever we lift the feet by hand lever or knee lifter. This way, we can remove the work from the machine easily, when the take up lever is at its highest point. I seriously appreciate your guys time and help. So moving on with some more complete newbie questions. Should I be hitting any other spots other than the spots market with red and the felt pad I havent seen on like that in a long time. This is the rod that pushes the tension release lever whenever we lift the feet by hand lever or knee lifter. This way, we can remove the work from the machine easily, when the take up lever is at its highest point. The manual I have must be the same one hobageeba has. It instructs you to turn the screw near the center of the spring. I have removed the bobbin and do not see anything that resembles a spring. I realize this thread is over a year old, but any help would be appreciated. Thanks. Been sewing for years on my Consew 225 bought used, great machine without the tension release working just pulled the thread at top to get the slack I needed. What a dumb discovery on my part, thanks to all of you on this forum. All of you are the greatest, again thank you.Paste as plain text instead Display as a link instead Clear editor Upload or insert images from URL. View cart for details.

Login to post The needle wont stay in place. Do I need to replace the needle bar clamp.They should be able to supply manual for you to use. These can usually be downloaded at no charge.Any ideas With modern machines, its usually to the rear, away from you, but with older machines there was more variation. The most common reason the needle wont pick up the bobbin thread is because the flat side of the needle is facing the wrong way for that machine. Hope this helps! Robbie Or, click on google and enter the search terms. There are a lot of places to get service manuals. Consews are free. You may have to pay a few buck from other places but they arent expensive. The stitch looks ok. I have a Consew 226r1 that runs and works very well, except for the fact that I cannot change the stitch length. I own the manual and the parts manual but following the directions does not work.

<http://dzkgjy.com/images/canon-eos-2000-rebel-manual.pdf>

When I depress the left hand button on the bed plate and turn the wheel towards me the button will drop down and at that point when I try to turn the wheel to change the stitch length the clutch will disengage. When I depress the right hand button the clutch will reengage but the stitch length will not have changed. Help!! Answer questions, earn points and help others. Frank B. 2.0 out of 5 stars I decided to try this one with the synchronizer on an overlock machine and am not happy with the needle position function as I was unable to properly program the stop positions. I at first had to assume I was missing details in the instructions but the instructions in the box are a terrible translation from the Asian language of the manufacturer. As an Industrial Sewing Machine Technician for over 37 years I have seen poor instructions in English from translated Japanese manuals so I am somewhat used to it. Over the years I have set needle positions on probably most every brand of servo motor made I found better instructions on Consews website but still setting the proper needle stop positions was impossible on the overlock machine I installed this motor on. I contacted Consew and they offer no help or better detailed instructions.

<https://dyodocs.com/images/canon-eos-20d-manual-download-pdf.pdf>

My machine pulley design makes it impossible to rotate the synchronizer on the pulley to mechanically adjust the synchronizer so I internally modified the magnetic disc to rotate so I could set the needle position. internally. I am stuck with only one needle position, but that is okay on an overlock machine as needle down is really not needed. It is possible the synchronizer or control box are faulty but I really did not care to waste the time.and leave my machine down any longer.My next motor purchase where needle position is a concern will probably be from another brand or through an Industrial machine dealer.I realized that I was never going to sew enough to be able to control the clutch style motor on my Consew 226R. So, I thought I would try this servo motor. It was a direct bolt in replacement. I set the speed at the lowest setting and I finally had full control. Looked totally professional. FYI the needle synchronizer did not fit my machine. Will need to fabricate a different adapter and it uses a different bolt than what is supplied.You can not do a single stitch speed with

this motor, it only slows down to 500 spm. If you are wanting to do very slow stitches this is not the motor for you. 2 The instructions are ridiculously bad. You are on your own for installation and setup and there are no instructions for the needle positioner. 3 My needle positioner was broke into several chunks when it arrived. It is made of very brittle plastic. I recommend choosing a different product if you are buying a Servo motor. Great item! The programming sheet that came with it is mostly wrong but I was able to figure it out by playing with it. It actually takes less steps than the sheet shows to adjust things! This motor made my life a fingers so much happier and safer. Thanks for this I bought the 50mm pulley and can slow my stitching to about 2 stitches a second, giving me full control of my stitching. Great Great device. The metal clip make a little noise when making bobbin.

This motor allow me to use the existing belt, not a big deal but theres advantage over others. I would buy same model if needed. For example, if you find a For this, a lightweight single Always remember, Buy selflubricating machines as Get an adjustable This allows you to set the height Large people If the rigger is buying This allows The operator's manual tells you The parts manual Replace the needle and bobbin, and the machine again is A good zigzag machine will Its primary purpose is for zigzag By changing The next machine should be. Please try again. I picked it up used on craigslist. 1 What direction does the thread come off the bobbin.

Clockwise or Counter Clockwise 2 Where is the screw to adjust the bobbin tension Here is a manual for that machine. That should help.. 226R1.pdf Im just confused because 2 videos on YouTube show counter clockwise and it seems to do good in that direction. I still cant figure out how to increase bobbin tension. There is a small screw on the bobbin case that sets the bobbin tension. The Consew 206RB5 is larger, heavier and therefore, designed to handle more challenging tasks, such as auto, boat and furniture upholstery; tents; tarpaulins; sails; camping and sports equipment; awnings; umbrellas; shoes; purses; luggage and the like. It is also a good option for sewing apparel and coats for men, women and children. At A Glance The Consew 206RB5 is a full size table mounted machine with lots of features that are not available on the portable 206R. Some of these features are available on the 206RB5 merely because it is mounted on a table. Consew 206RB5 Those features include a separate bobbin winder and a bobbin storage compartment on the right side of the machine. There is also an on board ruler and lamp as well as a cone thread stand that is designed to hold two extralarge cones of thread simultaneously. An extralarge bobbin In addition to those enhancements, the straight stitch only Consew 206RB5 also has an extralarge bobbin, a large reverse stitch lever, adjustable stitch length up to 10 mm and a centralized lubrication system that makes routine maintenance quick and easy. The stitch length adjustment dial is on the column. The oversize reverse stitch lever is directly beneath the stitch length adjustment control. The proximity of these two controls is not only efficient, the design is ergonomic as well. The process is relatively easy to figure out. The super quiet Servo motor is a major advantage over a clutch motor.

With this motor installed on an industrial sewing machine the noise level in a workroom is reduced so much that it is actually possible to hear a pin drop when it is turned on and idle. Like all industrial sewing machines, when the Consew 206RB5 is engaged, there is noise, but not so much so that I would consider it to be excessively loud. There is also some vibration, but not so much that it would interfere with the machine's operation or its finished products. The stitch quality is superb. This is to be expected when working with a single function machine. When a machine does just one thing, you are entitled to fully expect it to do that one thing exceptionally well. That is definitely the case here. Each stitch, regardless of the selected length, comes out with precise accuracy and perfection. Sewing on the Consew 206RB5 is comfortable and lightning fast. A sewing speed of more than 3000 stitches per minute can be intimidating to anyone who is not accustomed to working on an industrial machine. There are plenty of sewing machines designed for industrial use that are not as fast as this one. Needle The heavy duty walking foot and the extralarge bobbin make it possible to work for extended periods of time without having to stop to change the bobbin. Having the table mounted bobbin winder paired with the bobbin storage tray alongside it is an added advantage because you can wind multiple bobbins while sewing and have as many bobbins as you need to finish a task at the ready. Wind multiple bobbins while sewing Working on the Consew 206RB5 is not a real challenge for anyone who is accustomed to using a sewing machine. Reading the manual, however, is no real help. Like the manuals written for all Consew models and other machines manufactured in parts of Asia, the manual is written by people for whom English is not the first language. The grammar, spelling and sentence structure is quite challenging to say the least.

If you are interested in making shoes, handbags, luggage, or if sewing upholstery whether it is for furniture or automobiles, the Consew 206RB5 might be the perfect fit to satisfy your needs. The fact that it can handle sailcloth, and all weights of leather, suede and vinyl is a definite advantage. The excellent stitch quality and the fact that this machine can produce stitches up to 2. While stitches as long as that are not required by the average home sewer, they are an absolute necessity for those of us who engage in special projects and especially for those businesses that engage in manufacturing certain types of specialty products. If your sewing projects are too large or bulky for the sewing machines in your home, you owe it to yourself to take a close look at the Consew 206RB5. If your business is one that requires the type of sewing machine that can sew more than 3000 stitches per minute and sew through extra thick layers of fabric as well as leather, vinyl and canvas with ease, I suggest that you visit your local authorized Consew dealer and ask for a demonstration of the Consew 206RB5 the next time you are in the market for a new straight stitch only sewing machine to add to your workroom. My one word of caution is to be sure you are comfortable working on this machine before purchasing it. The owner's manual is going to be of little help if you need to refer to it in order to set the machine up, operate or maintain it, or to troubleshoot any problems that may come up during the life of this machine. Performance Stitch quality Speed Ease of use Maintenance Pros High Speed industrial sewing machine Cons Difficult to understand owner's manual 20150310 4.6 Overall Score Reader Rating 1 Vote Others Related Posts 4.8 Alphasew PW 200 Review February 15, 2015 1 4.4 Consew Model 14TU854 Overlock Machine Review October 3, 2014 1 4.8 American Home AH 100 Review May 18, 2014 4.

8 Handi Quilter Sweet Sixteen Review February 4, 2014 4 2 Responses My problem is that after sewing for 10 minutes, the upper tension is so tight as to either break the thread or shred the thread. I've been trying adjusting the upper tension to no avail. And you are correct, the handbook is useless. Help! Adjustments are certainly doable without help from the manual. Notify me of followup comments by email. Notify me of new posts by email. Learn how your comment data is processed. Share This Site Latest Reviews This website is a true labor of love. The passion for sewing blossomed in me many years ago. Since making that very first apron as a gift for my mom, I learned lots of tips and tricks to help me create some fabulously interesting clothes, accessories and home decor accents. In addition, I will be happy to answer any questions you may have, and welcome your

email. Happy Sewing! Popular Posts. It may not display this or other websites correctly. You should upgrade or use an alternative browser. Its a consew 226R1 which I was told was a decent machine. Ive been practicing with it and the Bobbin tension isnt tight enough. The owners manual says theres a screw that adjusts the tension but I cant seem to find it. Are there any upholsterers on here that might have a picture showing where this screw is at near the bobbin. Im trying to make a pleated seat cover to see if I can even do this. So Ive got to figure this out myself. Ive tried changing the upper threads tension but it still has the same result with the bobbin thread being too loose. I was told the consew 226R1 is the same as a Singer but I dont know which one. There doesnt seem to be much repair info on these consew machines. There may not be a commercial sewing machine repair shop within easy distance but here locally the Bernina dealers repair guy works on all kinds of machines. If they dont have an answer they probably will know where to send you for one.

You said your bobbin thread is loose, by this do you mean that you are getting loping on the bottom side of the fabric. Usually, if that is the case youre looking at an UPPER tension problem, not bobbin case problem. Same with a stitch where the bobbin thread pulls easily out, but otherwise the stitches look okay. I was in the household sewing industry for right about thirty years, so I am far from an industrial specialist, but I have worked on tons of commercial stuff over the years. Rons been doing industrial machines for 40 years and can fix anything. P.S. He has 2 deuces and a 34 all hot rods. Right here on the HAMB! So Ive got to figure this out myself. There doesnt seem to be much repair info on these consew machines. Click to expand. The link I provided you previous was posted by a pro and he is on that forum all the time and provides lots a help. Go there and post this. This one looks as though it would be good for harness and container work. Is that a correct assumption. What would be a fair price for this machine Any recommendations for a good allpurpose, but suitable for canopy, machines. There apparently was a Consew 266 but I cant find a parts diagram or a even a photo of the thing anywhere. Only very passing references for a couple of parts. If thats what it is its an oddball. Im old for my age. It is a 226, not 266. I have not looked at the machine but that is what it is advertised as. Here is some of the text from the add From the pictures it looks like a more appropriate machine for what I am looking for, but I am again interested in feedback, it doesnt seem to be one of the model numbers referenced in threads here We have 10 of them there. Paste as plain text instead Display as a link instead Clear editor Upload or insert images from URL. You can then type in your model number and hit enter it will tell you if the instruction manual is on this page and navigate you to it. If the manual is not on this page, we do not have it in our collection.
